EDUCATION & ACHIEVEMENTS

UNIVERSITY OF INFORMATION TECHNOLOGY, VNU-HCM (UIT)

Bachelor's Degree in Information Technology

GPA : 8.4/10

IELTS : 6.0

TECHNICAL SKILLS

Backend: Java, Spring Boot, Spring AOP, Spring Security, Node.js, Express.js

Database: PostgreSQL, Redis (Caching, Distributed Lock)

Tools & Infrastructure: Git

Testing: JUnit 5, Mockito, Spring Boot Test

Protocols & Patterns: RESTful API, WebSocket, JWT

WORK EXPERIENCE

HDBANK – GALAXY INNOVATION HUB | *Backend Developer Intern*

01/2026 – 05/2026

- Developed and maintained RESTful APIs using Spring Boot for basic transactions system that using PostgreSQL, including optimizing query performance through proper indexing, clean separation of business logic and data access layers .
- Collaborated in an Agile team environment, participated in code reviews and daily standups to deliver the capstone project on schedule.

PROJECTS

PITCH MANAGEMENT SYSTEM | *Backend Developer*

GitHub: github.com/ducpham211/pitch-management-system

What I've done :

- Designed RESTful APIs with Spring Boot & MapStruct; integrated Redis caching, reducing average query latency from ~15ms to ~2ms for high-frequency endpoints combine writing Unit & Integration Tests (JUnit 5, Mockito, @SpringBootTest) to ensure the efficiency.
- Implemented Redis Distributed Lock to prevent overbooking race conditions, guaranteeing 100% booking consistency under concurrent requests.
- Replaced HTTP polling with WebSocket (STOMP), cutting notification delivery from ~3s polling intervals to real-time push (<50ms).
- Adopted stateless JWT authentication, eliminating server-side session storage and enabling horizontal scaling without session replication

AUTO AUDIT LOGGING STARTER | *Core Library Developer*

GitHub: <https://github.com/ducpham211/auto-audit-logging>

What I've done :

- Developed a plug-and-play Spring Boot Starter utilizing Spring AOP (@Around) to non-invasively automate audit logging, extract execution context, and eliminate boilerplate code.
- Engineered an asynchronous (@Async) logging mechanism with a dedicated ThreadPool to ensure zero latency impact on main transactions.
- Implemented Data Masking via Jackson BeanSerializerModifier and memory-safe filters to dynamically skip large binary streams.
- Ensured library reliability with Unit & Integration Tests (JUnit 5, Mockito, @SpringBootTest) covering AOP interception, binary-data filtering, and JSON data masking.
